

STORED CHIP POTATOES Crop Code: 1304

Standard Message:

NOTE: If scab is a problem, disregard any limestone recommendation. Apply none at all.

Limestone recommendation, if any, is to bring the soil pH to 6.0. For most other vegetable and agronomic crops, a soil pH of 6.5 is recommended. Multiply the exchangeable acidity by 840 to estimate the lime requirement for pH 6.5.

If limestone is recommended, do not apply more than 3000 pounds per acre of calcium carbonate equivalent the year before planting potatoes. The remainder should be applied after the potato crop has been harvested.

When planting potatoes following a legume or legume grass mix, the amount of N supplied should be factored into a fertilization program. A general rule would be to estimate a minimum of 80 lb of N being supplied by the previous legume or legume/grass mixture.

Livestock manure is recommended in moderate amounts. Apply only enough manure to partially supply the crop nutrient needs. Be sure to reduce the amount of fertilizer applied after manure applications. Excessive use of manure may aggravate a common scab problem.

Make adjustments in your plant nutrient needs based on your previous cropping experience. Take into account the variety planted, management practices and the use of the potatoes that are being produced. If vine growth has been excessive in past seasons, reduce N applications. Excess N may improve yield but will often reduce storage life, promote color problems, and reduce specific gravities.

See back message 7,12, and 13 for additional information.

Lime and Magnesium Recommendation:

pH Goal: 6.0

Opt soil test Mg (ppm): 100

Nitrogen Recommendation (lb N/A): 200

Phosphorus Recommendation (lb P₂O₅/A):

(Optimum soil test P: 35 - 55 ppm)

Soil test P (ppm)	P ₂ O ₅ lb/A
0	240
5	220
10	200
15	170
