POLL OVERVIEW

The 2007 Penn State Poll was the nineteenth annual omnibus survey conducted by the Center for Survey Research (CSR) at Penn State Harrisburg. This year's Poll measured the opinions and knowledge of adult Pennsylvanians on social, economic, and political issues, as well as gathered their responses to questions about food safety, crime victims' rights, long-term care, homeland security issues, and the Penn State Milton S. Hershey Medical Center/Penn State College of Medicine. These topics were suggested and supported by the survey's sponsors. The sponsors of the 2007 Poll were:

PennAg Industries Association

Pennsylvania Commission on Crime and Delinquency, Office of Victims' Services

Pennsylvania Department of Public Welfare

Penn State Milton S. Hershey Medical Center/Penn State College of Medicine, Strategic Services

Shaun L. Gabbidon, Ph.D., School of Public Affairs, Penn State Harrisburg

A total of 862 telephone interviews with adult Pennsylvanians age 18 or older were conducted between October 17 and November 18, 2007. A margin of error of plus or minus 3.4 percent at the 95 percent confidence level is associated with survey results from a sample of this size. The sample drawn for the 2007 Penn State Poll used a random-digit-dialing (RDD) sampling procedure which guaranteed every landline telephone household in Pennsylvania had an equal chance of being selected. Moreover, a randomized respondent selection technique ensured that every adult within each sampled household had an equal probability of being interviewed. Project activity was directed by Auden D. Thomas, Ph.D., director of the Center for Survey Research at Penn State Harrisburg.

The purpose of the Penn State Poll is to provide timely and accurate data to agencies, organizations, and researchers with statewide interests and responsibilities. Sponsors of past Penn State Polls have used the results of the survey to track public policy issues, measure general attitudes, awareness, and knowledge of their organizations, and measure satisfaction with organizational services and performance. The Center for Survey Research at Penn State Harrisburg is committed to providing high-quality data to researchers and decision-makers.

METHODOLOGY

Instrument Modification

During September 2007, the CSR project team worked in consultation with the various Poll sponsors to develop and refine survey questions for use in data collection. A final instrument was developed which contained each of the sponsors' questions as well as several public opinion questions sponsored by CSR.

The survey instrument and study protocol were submitted to Penn State University's Office for Research Protections for review in September and were subsequently approved for use.

The instrument was programmed using Voxco computer-assisted telephone interviewing (CATI) software. The CATI program's interface allows complex questioning patterns and automatic skipping when appropriate to allow the seamless flow from one question to the next during the interviews. See Appendix A for a copy of the survey instrument used to conduct the interviews.

Sample Design

The sample drawn for the 2007 Penn State Poll consisted of telephone numbers selected at random from all of Pennsylvania's telephone exchanges using a random-digit-dialing (RDD) sampling procedure. This sampling technique guaranteed that every landline telephone household in Pennsylvania had an equal chance of being selected. Moreover, a randomized respondent selection technique ensured that every adult age 18 or older within each sampled household had an equal probability of being interviewed.

The RDD telephone sample frame was constructed by the Marketing Systems Groups (MSG) of Fort Washington, Pennsylvania. The default methodology for generating random-digit-dialing telephone samples in the MSG system provides for a single-stage, EPSEM (equal probability of selection method) sample of residential telephone numbers. In other words, for each and every RDD sample selected, MSG ensures an equal and known probability of selection for all residential telephone

numbers.¹ The structure of the database and the sampling methodology itself obviate the need to insure representative telephone samples. Thus, Marketing Systems Group RDD samples deliver the full statistical value of each interview without the reduction in precision normally associated with clustering effects.

MSG random-digit-dialing samples achieve their statistical efficiency through the highly structured master exchange database (MED) in combination with a single-stage systematic sampling procedure. The MED's basic structure contains eighteen independent strata: nine census divisions split by metro and non-metro county definitions.

Within each regional metro stratum, exchanges are ordered from those serving largest Metropolitan Statistical Area/Primary Metropolitan Statistical Area (MSA/PMSA), to those serving the smallest. Within each MSA/PMSA, exchanges are then ordered by those serving the county (or counties) containing the central city, followed by those serving the remaining non-central city county (or counties). And within each county, exchanges are ordered numerically, lowest to highest. For the nine-metro strata, exchanges associated with each county are ordered in a serpentine fashion within the state. The sample assigns to each and every number within an interval and consequently to each and every possible area code, exchange, and four-digit suffix a known and equal probability of being selected.

To ensure that each member of a sampled household had an equal probability of being interviewed, the last-birthday method of respondent selection was utilized. This second-stage sampling methodology is employed to enhance the generalizability of the survey data. Second-stage sampling is required to eliminate biases that arise from interviewing the person who answers the telephone.

The sampling methodology employed at both the exchange and household levels ensured that every landline telephone household in Pennsylvania had an equal chance of selection and that every adult within each sampled household had an equal probability of being interviewed. This procedure is a

¹ For this survey, CSR purchased the most comprehensively-screened type of random sample from Marketing Systems Groups. All dedicated and ported wireless numbers were identified and removed from the sample. CSR abides by the federal Telemarketing Consumer Protection Act of 1991 which prohibits survey researchers from dialing wireless numbers.

rigorous methodology which plays a key role in producing sample estimates that accurately reflect true population values.

Data Collection

Data for this project were collected by approximately 40 telephone interviewers using VOXCO computer-assisted telephone interviewing (CATI) software. The CATI system accommodated 20 concurrent interviewers and quality control supervisors assisted by VOXCO's monitoring and productivity tools. Before starting to interview, each CSR interviewer was trained in proper data collection techniques through a formalized interview training class, which included role-playing and feedback, in addition to the technical methodology of interviewing. Additionally, each interviewer was trained to become familiar with the Penn State Poll instrument. All interviewers completed Penn State University's Human Participants Seminar and passed an online training test administered through the University's Office for Research Protections.

Throughout the data collection period, ongoing interviewer training sessions were held to ensure data quality was maintained through 1) interviewer success in gaining respondent cooperation and 2) consistency in delivering the survey to respondents. CSR's Field Operations Coordinator assisted by two field supervisors were responsible for training, supervising, monitoring, and evaluating the interviewer staff throughout the data collection period.

A working draft of the survey instrument was pre-tested with a small sample of respondents before full-field interviewing began. This process provided details regarding the effectiveness and efficiency of the questionnaire. Pre-testing increases the likelihood that the questions provide accurate data and decreases the likelihood of collecting unusable data. Thus, it is an integral component of questionnaire design. The pre-test findings were reviewed, found to be error-free, and incorporated into the final dataset.

The interviewing for the Penn State Poll took place from CSR's call center on the Penn State Harrisburg campus between October 17 and November 18, 2007. Hours for interviewing for the project were Monday through Thursday from 5:00 p.m. to 9:00 p.m., on Saturdays from 10:00 a.m. to 6:00 p.m., and on Sundays from 1:00 p.m. to 8:00 p.m.

In addition to scheduling specific callbacks to accommodate respondents' schedules, CSR also attempted to contact households that were not reached initially. Follow-up calls to households that did not answer or where busy signals or answering machines were reached were scheduled for subsequent attempts at varying times of day or evening. Because these callbacks are the principal means by which response rates are increased, CSR interviewers attempted a maximum of 14 contacts to identify a number's actual disposition, with an average number of 3.74 call attempts per telephone number.

Calls continued until 862 interviews had been completed.

Data Preparation

All completed survey data were extracted from the CATI system into Statistical Package for the Social Sciences (SPSS) software. Weighting factors were applied to cases in the dataset to correct for biases introduced by non-response by segments of the population. These were calculated by comparing survey respondent age and gender demographics to known occurrences in the Pennsylvania population using U.S. Census data. Open-ended questions were coded into categories.

Final review of the survey data was conducted by the senior staff of the Center for Survey Research. Final survey datasets were created in SPSS for Windows version 15.0.

PROJECT STATISTICS

The final dataset includes cases from 862 Pennsylvanians.² A margin of error of plus or minus 3.4 percent at the 95 percent confidence level is associated with survey results from a sample of this size. This simply means that if the survey were conducted 100 times, the resulting data would be within 3.4 percentage points of the percentages reported in the survey results in 95 of the 100 surveys.

The survey cooperation rate was 42.9%, as calculated using the American Association of Public Opinion Research's Cooperation Rate 3 (COOP3) formula. AAPOR sets an industry standard for consistent reporting across the survey research field. For more information, see AAPOR's "Standard Definitions: Final Disposition of Case Codes and Outcome Rates for Surveys" at http://www.aapor.org/uploads/standarddefs_4.pdf.

The average length of a completed interview was approximately 18 minutes. Table 1 below displays a summary of project statistics.

Table 1. Project Statistics

Penn State Poll 2007 Survey	hrs/min/sec
Total connection time of all calls	815:29:37
Average length of one single completed interview	0:18:19
Average phone time per actual complete (total time/completes)	56:07
Total calls placed	31,827
Number of different phone numbers dialed	8,500
AAPOR Cooperation Rate 3 (COOP3)	42.9%

² There were 872 completed surveys collected but the results discussed in this report are based on the 862 weighted cases. See the section below on "Representativeness of Sample" for more information.

Call Dispositions

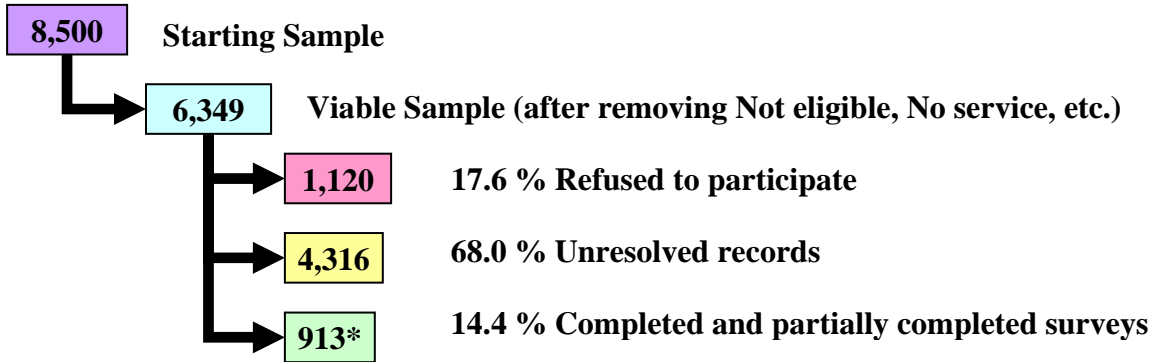

Table 2 below lists the frequencies and percentages of the dispositions describing the final outcome of all telephone calls placed for the survey.

Table 2. Final Dispositions of Calls

Disposition	Frequency	Percent
Completed	872	10.3
Break off: Don't Call Back (Partial Complete)	41	0.5
Answering Machine – Confirms Household	537	6.3
Answering Machine – Don't Know if Household	920	10.8
Break off: Call Back	2	0.0
Busy	211	2.5
No Answer	1,221	14.4
Respondent Unavailable: Definite Appointment	8	0.1
Respondent Unavailable: Indefinite Appointment	161	1.9
Temporarily Out of Service	7	0.1
No Screener Completed	1,249	14.7
Refusal by Gatekeeper	833	9.8
Refusal by Proper Respondent	287	3.4
Physically or Mentally Unable/Incompetent	76	0.9
Language Problem	75	0.9
Call Blocking	39	0.5
Not Eligible – Other	19	0.2
Not Eligible – Geography	8	0.1
Fax/Data Line	634	7.5
Non-working/Disconnected Number	695	8.2
Number Changed	38	0.4
Cell Phone	28	0.3
Non-residence	539	6.3
Total	8,500	100

Table 3 below illustrates the difference between the initial sample and completed percentage. The colored boxes below correspond to the sample and disposition descriptions above.

Table 3. Sample Breakdown

* Due to the weighting process, the number of completed and partially completed surveys indicated above (913) is higher than the number of completed survey cases (862) reported in this document. See the section below on “Representativeness of Sample” for more information.

SAMPLING ERROR

The margin of error for a simple random sample the size of the 2007 Penn State Poll is plus or minus 3.4 percentage points, when the distribution of question responses is in the vicinity of 50 percent. This sampling error presumes the conventional 95% degree of desired confidence, which is equivalent to a significance level of .05. This means that in a sample of 862 households there is a 95% chance or better that if all telephone households in Pennsylvania are surveyed, the results will not differ from the survey findings by more than 3.4 percentage points.

The distribution of sample responses is represented by the proportion of people responding to any question with a particular answer. For a sample size of 862 and a 50/50 distribution of question responses, the sampling error is 3.4 percentage points. A more extreme distribution of question responses has a smaller error range. Suppose that 80% of the respondents answer “Yes” and 20% answer “No;” then the sampling error in this case is 2.7 percentage points. That is, each percentage has a range of plus or minus 2.7 percentage points.

When analyzing demographic subgroups, it is important to keep in mind that they contain fewer than 862 respondents. Consequently, the sampling error for any subgroup is somewhat higher. Additionally, some questions were asked only of certain respondents; therefore, sampling error on these questions is also higher.

Table 4. Sampling Error in Percentage Points by Distribution of Question Responses and Sample Size

	<u>1200</u>	<u>1000</u>	<u>800</u>	<u>600</u>	<u>400</u>	<u>200</u>
50/50	2.9	3.1	3.5	4.0	4.9	6.9
60/40	2.8	3.0	3.4	3.9	4.8	6.8
70/30	2.6	2.8	3.2	3.7	4.5	6.4
80/20	2.3	2.5	2.8	3.2	3.9	5.5
90/10	1.7	1.9	2.1	2.4	2.9	4.2

As in all public opinion surveys, the results are also subject to other types of error inherent in the survey process.

REPRESENTATIVENESS OF SAMPLE

In order to ensure that the results of the Penn State Poll are not biased toward any singular demographic group or geographic region, the results of the survey were checked against the known occurrences of the demographic characteristics and the geographic distribution of Pennsylvania's population. The data source which CSR used to make this comparison was the U.S. Bureau of the Census, Detailed County Population Estimates, 2005. Census data were provided to CSR by the Pennsylvania State Data Center.

Weighting is utilized to better represent the population as a whole for those groups who are over or under-represented in the survey's final disposition. As previously indicated, every adult household member had an equal chance of being selected to participate in the survey. However, even when a rigorous respondent selection procedure is used, one specific demographic subgroup is sometimes over- or under-represented. When this occurs, the sample is weighted so that the sample's demographic profile accurately reflects the population's known properties.

The weights applied give each case a value so the percentage of responses in the sample approximates that known percentage in the population. For the 2007 Penn State Poll, cases were weighted as a function of each respondent's age and gender.

Table 5 below displays the age/gender categories used for the weighting scheme, the number of respondents interviewed within each age/gender category, the number of interviews expected within each age/gender category according to Census data, and the resulting weight applied to survey age/gender cases to norm the survey data to known population demographics.

Table 5. Weights Applied to the Survey Data

Age/Gender	# Interviewed	Census Expected*	Weight
18-24 male	14	56	3.990
18-24 female	18	55	3.046
25-34 male	38	67	1.763
25-34 female	45	66	1.463
35-44 male	55	79	1.440
35-44 female	72	81	1.122
45-54 male	79	80	1.016
45-54 female	120	83	0.692
55-64 male	62	59	0.955
55-64 female	110	64	0.585
65-74 male	51	38	0.747
65-74 female	81	48	0.594
75 and over male	31	31	0.998
75 and over female	86	55	0.634

* Numbers are rounded.

DEMOGRAPHIC PROFILE OF THE 2007 PENN STATE POLL

The following table displays a breakout of the frequency and percent of respondents in the weighted sample by demographic characteristics of geographic region, age category, education, ethnicity, race, income, and gender.

Table 6. Demographic Profile of the 2007 Penn State Poll

		Number in Weighted Sample	Percent of Weighted Sample
Region (see Appendix B for region definitions)	1	187	21.6%
	2	45	5.2%
	3	36	4.1%
	4	42	4.9%
	5	34	3.9%

T03

The following questions ask you about long term health care.

Continue 1 D

62:

Q17

Long-term care is however the respondent defines it! DN=Don't know/not sure; RE=Refused

How do you define "long-term care?"

\$L

Continue to Open Ended Verbatim O D

63: **T04**

Thank you. For the purposes of the questions you are about to answer, please consider long-term care in the following manner: long-term care provides a wide range of services or devices over an extended period of time to people who need assistance with daily activities such as eating, dressing, bathing, and so forth, to enable them to live as independently as possible. Examples of why someone might need long-term care services are long-term disease, disability, mental illness, mental retardation, or limitations associated with aging. These services can be provided by family, friends, or a paid provider.

Continue 1 D

64: **Q18**

During the past month, has anyone in your household received long-term care services?

- Yes 1 => Q18A
- No..... 2 => Q19
