

**WHAT ARE YOUR HERBICIDE  
STRATEGIES:**

**CAN YOU DO BETTER?**

**Penn State Extension**

Hopefully, some of this not...

## Reasons why weed control is important

- Moisture stress
- Nutritional stress especially nitrogen
- Animal habitat (voles & rabbits)
- Insect habitat (good & bad)
- Worker comfort

**Especially Young Trees  
or Replants**

# Is This Your Herbicide Strategy?

## **A ROUND TUIT**

This is a Tuit. Guard it with your life as Tuits are hard to come by, especially the round ones. This is an indispensable item. It will help you become a more efficient worker. For years we have heard people say, "I'll do it as soon as I get a round tuit." Now that you have one, you can accomplish all those things you put aside until you got a ROUND TUIT.

# A Plan of Attack

- How long in advance do you think about your weed control program?

## Point # 1

- Develop a multi-year strategy/approach
  - Prevents weed resistance development
  - At a minimum plan for two seasons

# How do you decide?

- Do You Scout the Orchard for Weeds?
  - You scout for disease and insects on a regular basis
- When do you scout for insects & diseases?
  - Usually look them a regular basis
- How often should you scout for weeds?
  - Early April
  - Around June drop
  - Late August

## Point # 2

# Know your orchard and the weeds

- Annuals vs. Perennials
- Soil types – clay vs sandy
- Weed dispersal methods
- No one method will control all weeds

# Orchard Documentation

- ID and record weeds
- Rate severity of weeds
- Look for trends or new species
- Note soil moisture conditions

# Identification Tools/Aids

## Stubborn Weeds of Pennsylvania

## Soil factors in Relation to Herbicides

- Soil residual herbicides that are mobile may be taken up by roots
- Lighter soils (i.e. containing more sand) have the potential for tree damage
- Soil residual not very mobile generally are safer for younger trees
- Heavy soils (i.e. containing clay) may bind herbicides up more reducing length of control

## Point # 3

# Product choices depend upon

- Species / variety of tree
  - Apples & pears more options
  - Gala G. Delicious more sensitive to 2,4-D?
  - Cherries & other stone fruits
- Age of trees
  - Contact materials
  - Tree guards
  - Residual materials

## Products having the same mode of action

HRAC	Product	Site of Action
1	Fusilade, Select Max, Poast	ACCase inhibitors
2	Sandea, Matrix, Solida, Pruvion	ALS inhibitors
9	Roundup, Touchdown plus others	EPSP Synthase inhibitor
4	Stinger, Starane Ultra, 2,4-D	Auxin receptors
5	Simazine, Sinbar	Photosystem II inhibitors
7	Karmex, Diuron	Photosystem II inhibitors
10	Cheetah, Glufosinate 280, Liberty, Rely etc.	Glutamine synthetase inhibitor
12	Solicam	PDS inhibitor
27	Broadworks	HPPD inhibitor
14	Aim, Broadstar, Chateau, Zeus Prime XE, Treevix, Goal, Galligan, GoalTender	PPO inhibitor
22	Gramoxone, Reglone	Photosystem I electron diverter
3	Kerb, Surflan, Prowl, Pendimethalin, Prowl H2O	Microtubule inhibitor
21	Gallery	Cellulose inhibitor Site B
29	Alion	Cellulose inhibitor Unspecified site

# Considerations for *annual* weeds

- Prevent seed production in tree rows
- Prevent seed production in drive rows = mowing more often

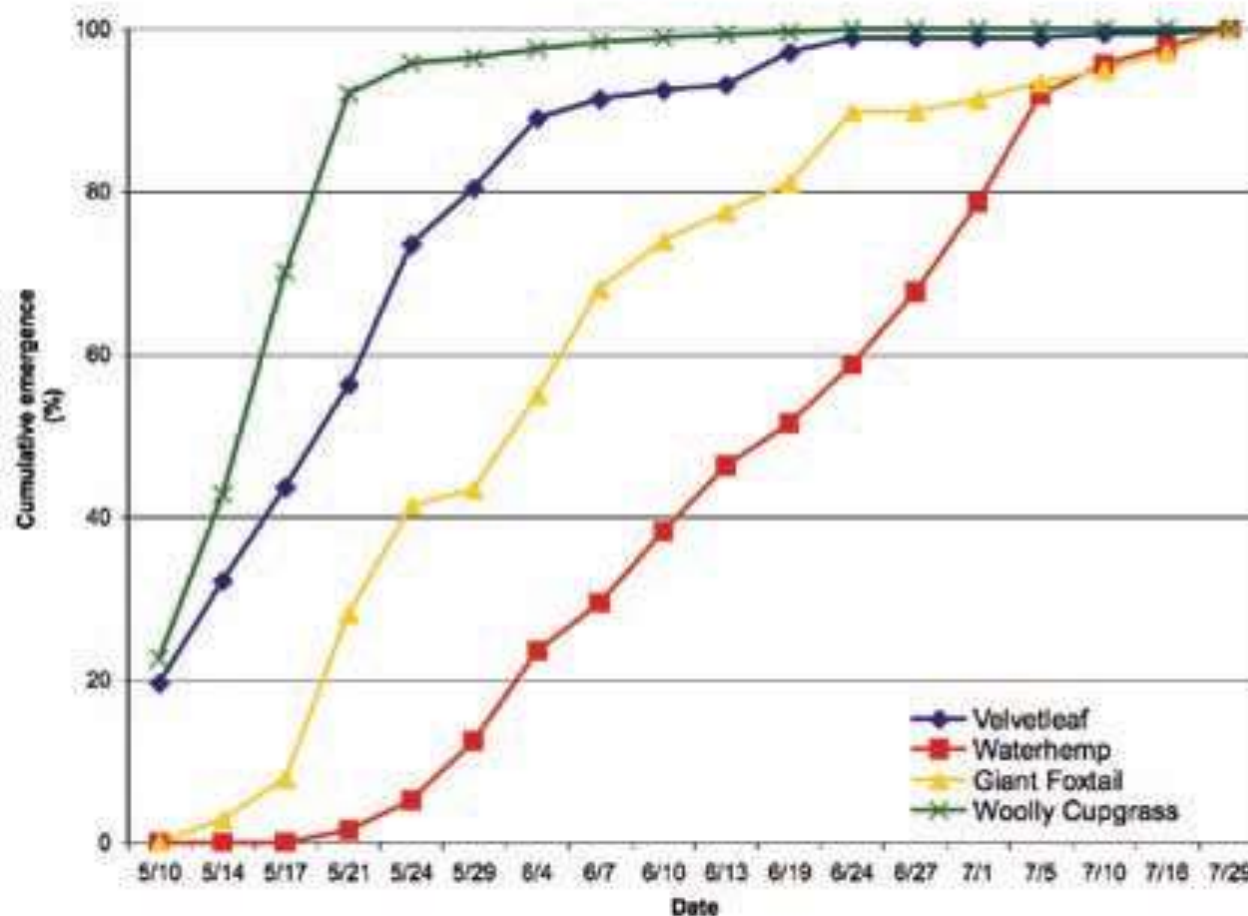

# Residual materials and length

- Karmex – 6-8 weeks
- Simazine – 6-8 weeks
- Solicam – 4-6 weeks
- Prowl – 4-6 weeks
- Surflan – 4-6 weeks
- Goal – 6-8 weeks
- Kerb – 4-6 weeks
- Sinbar – 8-10 weeks
- Casoron – 6-8 weeks
- Matrix – 3-4 weeks
- Sandea – 3-4 weeks
- Chateau – 3-4 weeks
- Alion - > 10 weeks

**So why can we get weed control for the season?**

Different weeds emerge at different times

# Weed Germination Periodicity

## Relative emergence of common weeds of summer annual crops

Previous fall	Early spring							Late spring
(Winter annuals & biennials)								
<u>GROUP 0</u>	<u>GROUP 1</u>	<u>GROUP 2</u>	<u>GROUP 3</u>	<u>GROUP 4</u>	<u>GROUP 5</u>	<u>GROUP 6</u>	<u>GROUP 7</u>	
Horseweed/marestail	Foxtail barley	Quackgrass	Smooth brome	Canada thistle	Green foxtail	Black Nightshade	Fall panicum	
Downy brome	Kochia	Orchardgrass	C. ragweed	Giant foxtail	C. milkweed	Shattercane	Crabgrasses	
Field pennycress	Prostrata knotweed	Giant ragweed	Wooly cupgrass	C. cocklebur	Hemp dogbane	Venice mallow	Morningglories	
Shepherd's purse	Wild mustard	P. smartweed	Velvetleaf	Yellow nutsedge	Barneyardgrass	Waterhemp	Jimsonweed	
Biennial thistles	Dandelion	Ladysthumb	Wild buckwheat	Redroot pigweed	Yellow foxtail	S. groundcherry	Witchgrass	
Wild carrot	Russian thistle	C. lambsquarters			Wild proso millet	J. artichoke		
Dandelion (from seed)	White cockle	Wild oats			Field sandbur			
		Hairy nightshade						
	Prior to crop planting		About the time of crop planting			After crop planting		

## 30 Year Average Germination

Weed	% Emergence	Landisville	Rock Springs
Large crabgrass	10%	8-May	17-May
Giant foxtail	10%	27-Apr	6-May
Yellow foxtail	10%	27-Apr	6-May
Lambsquarters	10%	23-Apr	30-Apr
Smooth pigweed	10%	11-May	19-May
Eastern black nightshade	10%	23-May	1-Jun
Common ragweed	10%	8-Apr	18-Apr
Velvetleaf	10%	27-Apr	6-May

Based on GDD base 48F

## Point # 4

- You need to know what your weed population is!

# Perennials ! sion

## Point # 5

### Considerations for *perennial* weeds

1. Manage to kill perennial portion
2. Prevent seed production
3. Utilize control tactics when root reserves are lowest
  - ✓ Bud to bloom
  - ✓ Late summer to fall
4. Need to combine both times of seasonal control

## Seasonality

- Perennial weeds are best controlled in the fall as carbohydrates move to roots with storage sugars
- Controlling perennial weeds are tougher in the spring and harder to eliminate

## Point # 6

# A New Strategy ?

## Fall Application of Herbicides

- Postharvest timing
  - General warming of fall & winter temperatures
- Winter annuals germinating
  - Chickweed, henbit, **marestail**, mustards, shepherd's purse, pennycress
- Good timing for perennial weed control
- Prevent weeds going to seed in early spring

## Fall Herbicides:

- Avoid the spring work crunch
- Reduce interfering vegetation that can reduce pre-emergent effectiveness
- Buys time for later pre-emergent applications
- Allows another window in case spring weather is not favorable
- Can be applied as long as ground is not frozen
- Cold winter temperatures can reduce herbicide degradation and extend control

## Choice of Materials

- Burn down + residual
- New materials would be more effective
  - Alion, Matrix, Prowl, Goal, Chateau
- Older materials that fit this window
  - Surflan, Kerb,

# Weed Germination Periodicity

## Relative emergence of common weeds of summer annual crops

Previous fall      Early spring       Late spring

(Winter annuals  
& biennials)

### GROUP 0

Horseweed/marestail  
Downy brome  
Field pennycress  
Shepherd's purse  
Biennial thistles  
Wild carrot  
Dandelion  
(from seed)

### GROUP 1

Foxtail barley  
Kochia  
Prostrata knotweed  
Wild mustard  
Dandelion  
Russian thistle  
White cockle

### GROUP 2

Quackgrass  
Orchardgrass  
Giant ragweed  
P. smartweed  
Ladysthumb  
C. lambsquarters  
Wild oats  
Hairy nightshade

### GROUP 3

Smooth brome  
C. ragweed  
Wooly cupgrass  
Velvetleaf  
Wild buckwheat

### GROUP 4

Canada thistle  
Giant foxtail  
C. cocklebur  
Yellow nutsedge  
Redroot pigweed

### GROUP 5

Green foxtail  
C. milkweed  
Hemp dogbane  
Barnyardgrass  
Yellow foxtail  
Wild proso millet  
Field sandbur

### GROUP 6

Black Nightshade  
Shattercane  
Venice mallow  
Waterhemp  
S. groundcherry  
J. artichoke

### GROUP 7

Fall panicum  
Crabgrasses  
Morningglories  
Jimsonweed  
Witchgrass

Prior to crop planting

About the time of crop planting

After crop planting

# Fall applications of Alion

Trt #	Description
1	Control
2	Alion 5 oz/ac applied <u>11/4/09</u>
3	Alion 6.5 oz/ac applied 11/4/09
4	Alion 5 oz/ac plus Roundup Power Max 1qt/ac applied 5/25/10
5	Alion 5 oz/ac applied 11/4/09 and Alion 3.5 oz/ac plus Roundup Power Max 1qt/ac applied 5/25/10
6	Alion 5 oz/ac applied 11/4/09 and Alion 5 oz/ac plus Roundup Power Max 1qt/ac applied 5/25/10

## Conclusions

- Reduction in Pa smartweed, woodsorel nightshade & grasses, white clover, chickweed, groundsel
- No control of dandelion
- Alion applied in the fall will not provide season long control next year
- No difference between 5 oz. vs. 6.5 oz./A

## Point # 7

### Know Your Contact Materials

- Contact systemic not soil active
  - glyphosate
  - important tool for perennials in older orchards
- Contact systemic some soil activity
  - 2,4-D, clopyralid, fluroxypyr
  - watch for water influxes resulting in uptake
- Contact not systemic no soil activity
  - paraquat, glufosinate ammonium, pyraflufen-ethyl
  - multiple applications needed

- Contact materials – kill above ground portions only (perennials)
- Weather during and after application
- Systemic move from foliage to roots
  - Potential for absorption by tree roots

# Contact materials

- Know the proper leaf stage (height) to apply
  - Smaller weeds ( $\leq 4''$ ) are more easily controlled
  - Take into consideration leaf size & characteristics
  - Necessity of proper adjuvant

## What affects post emergent herbicide absorption?

- Amount and type of leaf wax
- Temperature affecting drying
- Wetting characteristic of herbicide solution

Why do we recommend applying post emergent materials to non-stressed plants?

- **Plants exude more wax onto the leaf surface when they are under water stress. A defensive response to limit water loss through evapotranspiration**

## Recommendation:

- Residual + Contact material
- Combinations to cover weaknesses
  - Simazine controls wide range of weeds but weak on grasses
  - Sencor is weak on broadleaves but effective on summer grasses
  - Neither is great on deep rooted perennials
  - Combined they provide a broader range of control

## Point # 8

### Know Herbicide Characteristics

1. Contact, Systemic & Not Soil Active
2. Contact, Systemic & Some Soil Activity
3. Contact & Not Systemic Not Soil Active
- 4. Residual & Potentially Mobile**
- 5. Residual & Not Very Mobile**

# Residual Materials

- Potentially mobile, actively taken up by roots
  - simazine, diuron, terbacil
  - solicam, Casaron
- Not very mobile, not likely to be taken up by roots
  - indaziflam, rimsulfuron, oryzalin, pendimethalin, oxyfluorfen, pronamide
  - “weaker materials”
  - more precise directions
  - need to use in combination

# Combinations

1. Simazine + Solicam
2. Matrix + pendimethalin
3. Alion + simazine
4. Others...

**All should add glyphosate for perennials**

## Point # 9

# How often do you check your herbicide sprayer?

- Have a good set of nozzles on the sprayer
- If two nozzles need replaced, replace all of them
- Applicators do not change nozzles often enough
- Use label specified nozzle
